

Please read our [book](#) and we hope you learn more about the deadly Parvovirus. We are trying to get this book into as many hands as possible. As more people are better educated about Parvo, it will claim far less victims each year.

Most people are under the false impression that vaccinations are 100% and if a dog has the full series of shots, it should never be infected with Parvo. Sadly, this not the case; most vaccines manufacturers will concede their products are not 100% effective and to make matters worse, not many vaccines can protect against the 2c Strain (aka F-Strain) of Parvo.

We strongly recommend that you use [Progard](#) vaccines, as to the best of our knowledge, this is the only brand that has been 100% challenge-tested against the latest [2c Strain of Parvo](#).

This strain is highly virulent, and most brands of vaccine do not provide full protection against it. That is one reason why we are hearing so many stories about fully vaccinated dogs still being infected by and dying from Parvo.

As you can see from over 50 news stories, many places around the country as well as outside of the country are really being hit hard with Parvo cases (much more than in past years). Please take a look at the [Breaking News](#), where you will see animal shelters, rescues, humane societies, and others are struggling to deal with Parvo outbreaks.

We could certainly use your help if we are going to make even a dent in the war on Parvo. This is another reason for the book - if you give out the link to it and ask people to download it and read it, and have them do the same, this will make the rounds and more people will have better chances at saving their dogs.
